No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

New polynucleotide, useful for preparing a composition for diagnosing, treating or preventing cancer. WPI; 2003-342398/32.

Claim 1; SEQ ID NO 343; 308pp; English.

The present invention relates to compositions and methods for the therapy and diagnosis of cancer, particularly breast cancer. The method for detecting the presence of a cancer in a patient comprises obtaining a biological sample from the patient; contacting the biological sample with a binding agent that binds to the polypeptide; detecting in the sample an amount of the polypeptide that binds to the binding agent; and comparing the amount of the polypeptide to a predetermined cut-off value. Treating breast cancer comprises administering a composition comprising breast tumour proteins and nucleic acids, which simulates and/or expands T cells

The present invention relates to compositions and methods for the therapy detecting the presence of a cancer in a patient concer. The method for biological sample from the patient, contacting the biological sample with a binding agent that binds to the polypeptide; detecting in the sample an amount of the polypeptide that binds to the binding agent, and comparing the amount of the polypeptide to a predetermined cut-off comparing breast cancer comprises administering a composition comprising breast specific for the tumour proteins and nucleic acids, which simulates and/or expands T cells specific for the tumour protein. The present sequence was used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              114

This invention relates to novel polypeptides associated with Molecules for Disease Detection and Treatment (MDDT) and the cDNA sequences which encode them. MDDT-antagonists, MDDT-agonists or gene therapy may produce cardiant, cytostatic and neuropyrotective activities. The polypeptides and composition for the diagnosis or treatment of a disease which is associated with decreased expression or over-expression of functional MDDT proteins, for example cardiovascular, neurological, cell proliferative, autoimmune/inflammatory or developmental disorders. They may also be useful in the treatment and diagnosis of cancer, diseases treated with steroids and disorders caused by the metabolic response to treatment with steroids. The present sequence is the cDNA sequence encoding a human Molecule for Disease Detection and Treatment (MDDT) of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            114
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     207
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   267

New polynucleotide, useful for preparing a composition for diagnosing

```
The present invention relates to compositions and methods for the therapy and diagnosis of cancer, particularly breast cancer. The method for beteeting the presence of a cancer in a patient comprises the partial of a biological sample from the patient; contacting the biological sample with a binding agent that binds to the polypeptide; detecting in the sample and amount of the polypeptide that binds to the binding agent; and comparing the amount of the polypeptide to a predetermined cut-off value. Treating breast cancer comprises administering a composition comprising breast undour proteins and nucleic acids, which simulates and/or expands I cells specific for the tumour protein. The present sequence was used to
                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           638

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to compositions and methods for the therapy and diagnosis of cancer, particularly breast cancer. The method for detecting the presence of a cancer in a patient comprises: obtaining a biological sample from the patient; contacting the biological sample with a binding agent that binds to the polypeptide; detecting in the sample with amount of the polypeptide that binds to the binding agent; and comparing the amount of the polypeptide to a predetermined cut-off value. Treating breast cancer comprises administering a composition comprising breast tummour proteins and nucleic acide, which simulates and/or expands I cells specific for the tumour protein. The present sequence was used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                158

An isolated polypeptide comprising an immunogenic portion of a breast tumor protein used for inhibiting the development of cancer, especially breast cancer, and monitoring cancer progression in a patient. Claim 4; Page 185-186; 187pp; English.

The present sequence is given in a specification relating to compositions and methods for the treatment and diagnosis of breast cancer. Nucleotide sequences that are preferentially expressed in breast tumour tissue, and compositions and vaccines to inhibit the development of cancer, especially breast cancer. The progression of a cancer may be monitored by carrying out detection of tumour-specific antiqens at subsequent time points and comparing the results from the different time points. CD4+tumour-specific antiqens at subsequent time tumour-specific polypeptides, polynucleotides encoding the polypeptides or antigen presenting cells expressing the polypeptides or antigen presenting cells expressing the polypeptides are then administered to the patient to inhibit development of cancer

The present invention describes polymucleotide sequences (I) which encode prostate-specific proteins (II). (I) and (II) have cytostatic activity, and can be used in vaccine production and gene therapy. (I), (I), (II) tusion proteins comprising (II), and isolated T cells prepared using (I) or (II) are used treat cancer in a patient. (I) and the antibodies are also used in the detection of cancer in a patient. The cancer that is diagnosed or treated is particularly prostate cancer. (I) and (II) can be used in vaccines. The ankibodies or (I) can be used for monitoring the progression of cancer in a patient. (I) and (II) can be used to improve diagnostic and therapautic methods for prostate cancer. They can indicate the level of metastasis as well as the prostate volume. AAH93357 to AAH93944 and AAM01115 to AAM01318 represent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

The invention relates to isolated prostate-specific polynucleotides, polypeptides, fusion proteins of the polypeptides, antibodies raised against the polypeptides (or antigenic epitopes derived from them) and antigen-presenting cells expressing the polypeptides. The antibodies are useful for detecting the presence of cancer, especially prostate cancer. The polypeptides, polynucleotides and the antigen-presenting cells are useful for stimulating and/or expanding T cells specific for a tumour protein, and for inhibiting the development of cancer especially prostate cancer. Compositions comprising the polynucleotide and/or polypeptide are useful for stimulating an immune response, and for treating cancer. The oligonucleotide is useful for detecting cancer. The present sequence is a prostate specific polynucleotide of the invention 158 218 398 282 CCCCAGAAAGGAICTCAICGICAIGGICAGGGACACGGAIGIGAAGAACAAGAGGACAAGGA 341 458 101 102 ekceciriesekacekadadarecakerederecekerecekeriederederedagaseka 161 221 281 401 for CGGCAAGAAGGTGGGCGCTTGGGGAGACTACGATGACAGCGCCTTCATGGATCCCAG 162 CGGCAAGAGCAACGTGGCTTGGGGAGACTACGATGACAGCGCCTTCATGGATCCCAG GTACCACGTCCATGGAGAAGATCTGGACAAGCTCCACAGAGCTGCCTGGTGGGGTAAAGT 339 CCCCAGAAAGGATCTCATCGTCATGCTCAGGGACACTGATGTGAACAAGAGGGACAAGCA 399 AAAQAGGACTGCTCTACATCTGGCCTCTGCCAATGGGAATTCAGAAGTAGTAAAACTCGT 99 CAGGGGGAGCGGCAAGAGCAACGTGGGCACTTCTGGAGACCACAACGACTCCTCTGTGAA 42 caggoggagcogcaagagcaacgrooggaacrrcrosagaaccacaacgacrccrcrororaa 342 AAAGAGGACTGCTCTACATCTGGCCTCTGCCAATGGGAATTCAGAAGTAGTAAAACTCGT Gaps New human prostate-specific polypeptides and polynucleotides useful the diagnosis and treatment of cancer, especially prostate cancer. ; 0 89.2%; Score 831.8; DB 4; Length 879; 99.8%; Pred. The present invention describes an isolated polypeptide (P1) comprising at least an immunogenic portion of a prostate-specific protein, or its variant. Also described are polymuclectides (N1) encoding (P1). (P1) and (N1) have cytostatic activity and can be used in vaccine production. The

polypeptides, nucleic acids and antibodies from the present invention are useful in the diagnosis and therapy of prostate cancer. Prostate specific genes PrO4P, PT2P, PT4P, pT75P and B305D are located in a genomic region on chromosome 22q11.2 known as the Cat Eye Syndrome region. Prostate specific antigen (PSA) P501S was located on chromosome 1. ARM84671 to AAM85143 and AAG99000 to AAG99077 represent polymucleotide and polypeptide sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 521
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           638
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             698

SXS

The invention describes a fusion protein comprising at least one amino acid sequence of immunogenic portions of any of the 3 sequences not defined in the specification, or sequences having at least 70 or 90 % sequence identity to any one of the 35 sequences defined in the USPTO web site, which is encoded by any of the 4 nucleotide sequences not defined in the specification. The fusion protein, composition and methods are useful for diagnosing, preventing and/or treating cancer, particularly prostate cancer. The proteins are useful as markers to indicate the presence or absence of cancer. This sequence represents a prostate cancer therapy associated cDNA. Note: The sequence data for this patent did not form part of the princed specification, but was obtained in electronic format directly from the US patent office at Prostate specific protein and its encoding polynucleotide, useful for the treatment and diagnosis of prostate cancer. New prostate-specific polynucleotides for diagnosing and treating diseases, in particular prostate cancer, and as markers for the progression of cancer.

Claim 1; SEQ ID NO 531; 87pp; English.

The present invention provides prostate-specific coding sequences and their encoded proteins. These can be used in the diagnosis and treatment of cancers, particularly prostate cancer. The present sequence is a CDNA described in the invention

Sequence 879 BP; 263 A; 193 C; 222 G; 201 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to novel breast tumour polynucleotides and polypeptides. The polypeptides and polynucleotides are useful in pharmaceutical compositions for treating and/or preventing cancer, particularly breast cancer, and for eliciting an immune response, particularly humoral and/or cellular immune response. The polynucleotides may be used as probes or primers for nucleic acid hybridisation, in the design and preparation of riboxyme molecules for inhibiting expression of tumour polypeptides and proteins, and in recombinant DNA molecules to direct expression of a polypeptide in host cells. AAS99570-AAS99888 represent novel human breast cancer protein coding sequences and PCR primers of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   158

The invention relates to a breast tumour polymucleotide selected from one of the 275 fully defined nucleotide sequences (a) given in the second that it is the complements, sequences consisting of at least 20 contiguous residues of a sequence in (a), sequences that hybridise to a sequence in (a) under moderately stringent conditions, sequences having at least 75% or 90% identity to a sequence in (a), or sequences having at least 75% or 90% identity to a sequence and isolated polypeptide (II) (comprising an amino acid sequence selected from to a sequence encoded by (a), sequences of 30 fully defined amino acid sequences (c), and sequences having at least 70% or 90% identity to a sequence in (2), expression vectors comprising (a), a host cell cransformed or transfered with the expression vectors comprising (a), a host cell cransformed or transfered with the expression vector, an isolated antibody or its antigen-binding fragment that specifically binds to (II), a method for detecting the presence of a cancer in a patient, a fusion protein comprising at least one polypeptide (II) and oligomucleotide that hybridises to (a), under moderately stringent conditions, a method for stimulating and/or expanding T cells specific for a tumour protein (by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New breast tumor proteins nucleic acids encoding such proteins, useful ir diagnosing, preventing and/or treating diseases such as cancer, particularly breast cancer, and as markers for detecting the presence of

contacting T cells with at least one component selected from (a), (II) and and antigen-presenting cells that express (II)), an isolated T cell population comprising T cells prepared from as detailed above, a method for stimulating an immune response or treating cancer in a patient by administering a composition comprising (a), (II), the vector, cells or the antibodies, and a method for inhibiting the development of a cancer in a patient. The polymorlectides may be used in the design and proparation of ribozyme molecules for inhibiting expression of the tumour polypeptides and proteins in tumour cells. The breast tumour proteins are useful as markers to indicate the presence or absence of a cancer, such as breast cancer, and in the detection of other cancers. Compositions preventing and/or treating diseases such as cancer. Darkers to indicate the presence or absence of a cancer, such as breast cancer. The present sequence is a breast cancer, particularly breast cancer. The present sequence is a breast cancer specific cDNA of the

The present invention relates to compositions and methods for the therapy and diagnosis of cancer, particularly breast cancer. The method for betecting the presence of a cancer in a patient comprises: obtaining a biological sample from the patient; contacting the biological sample with a binding agent that binds to the polypeptide; detecting in the sample an amount of the polypeptide that binds to the binding agent; and comparing the amount of the polypeptide to a predetermined cut-off value. Treating breast cancer comprises administering a composition comprising breast themour proteins and nucleic acids, which simulates and/or expands I cells sillustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

Research Center (DKFZ), Email s.wiemann@dkfz-heidelberg.de;
sequenced by GDE (National Research Centre for Biotechnology Ltd.,
Braunschweig/Germany) within the cDNA sequencing consortium of the
German Genome Project.
No s1 sequence available.
This clone (DKFZp781C0523) is available at the RZPD in Berlin.
This clone (DKFZp781C0523) is available at the RZPD in Berlin.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Clone distribution: MGC clone distribution information can be for through the I.M.A.G.E. Consortium/LIANL at: http://image.llnl.gov Series: IRAK Plate: 82 Row: i Collum: il
This clone was selected for full length sequencing because it passed the following selection criteria: Hexamer frequency ORF analysis, Genomescan gene prediction
This clone has the following problem: retained intron.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              103 GACTCCATGGACCAAGAGTACGCTGGTCGGGGTACCACATCCGGGACTGGGAACTGCGG
